

MSSQL: BACKUP AND RECOVERY

Backup

Steps

1. Opening the backup window

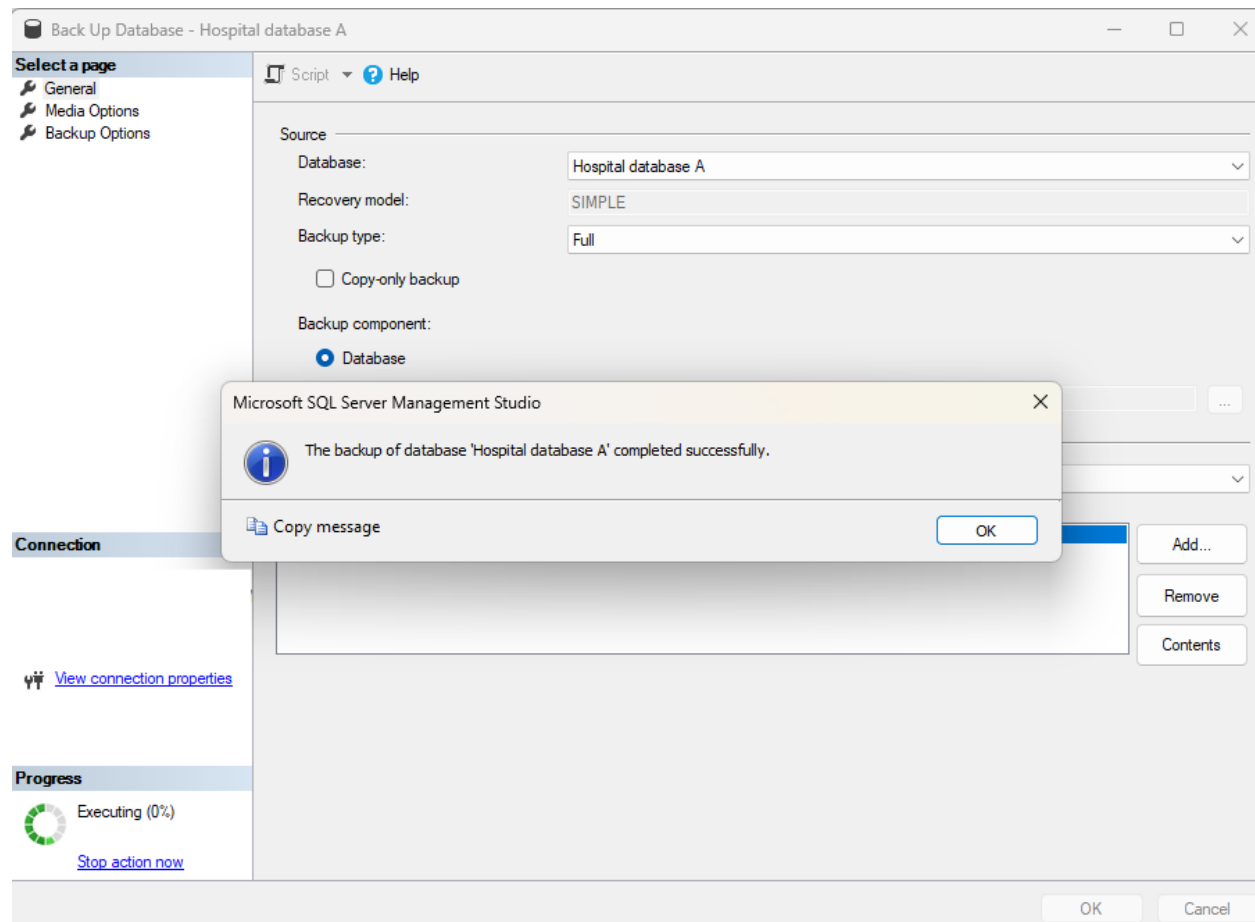

Right-click the specified database → Task → Backup. This opens a backup dialog where you configure how the database will be backed up.

2. Configure the backup

Select full as the backup and choose the backup destination. A full and compressed file ensures a complete copy of database and saves on space.

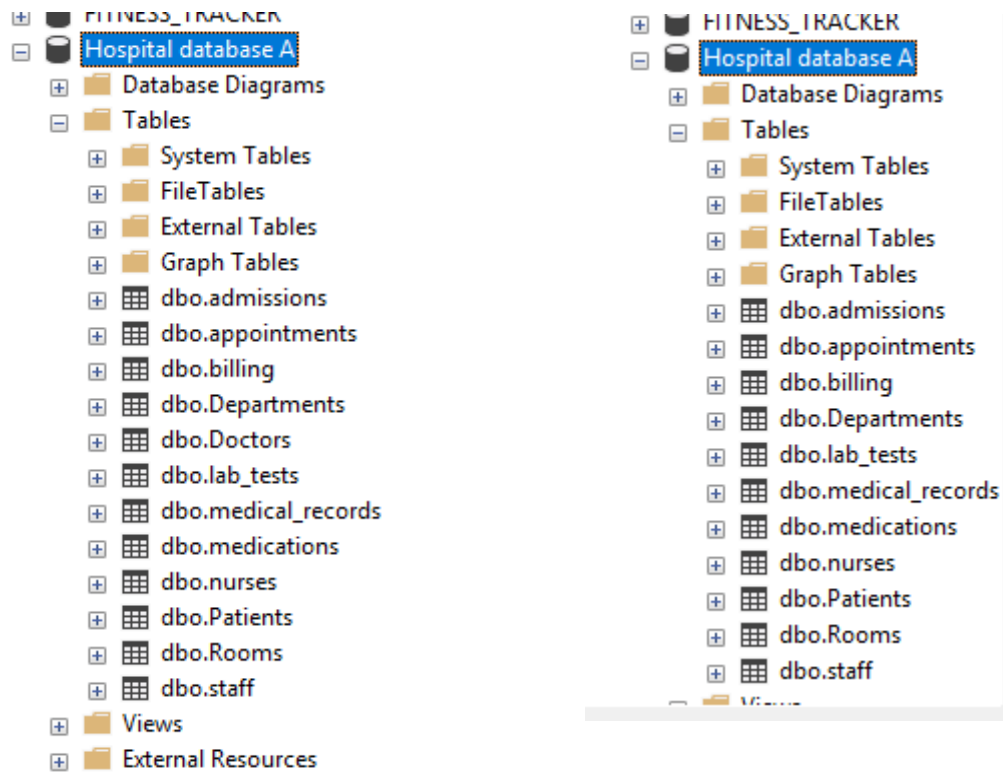

3. Execute the backup

Results is as shown below.

Recovery

Deleted Doctors table from hospital database as shown below

Steps of recovering Doctors table

Opening the restore window

Right-click the specified database → *Task* → *Restore*, select the backup file destination, configure the restore options and execute. Result is as shown below.
